modified:

created:

contentType:

dataType:

identifier:

reproductionUnstructured: El nido se puede encontrar en sitios muy protegidos como huecos de troncos, bajo musgos en barrancos de los ríos. Es esférico 14 cm diámetro por 13 cm de largo. La pared está elaborada en capas onduladas como las que se ven en los nidos de esfécidos e incluyen hojas de la planta de donde se sustentan; tiene varias aperturas en los costados y se han observado algunos con proyecciones como lengüetas que bajan desde la parte media de la cubierta; es difícil explicar su función (Sarmiento, 1997).
