reproductionUnstructured: Existen pocos datos de su reproducción; sus nidos son estructuras en forma de copa hecha con musgo verde, palos y hojas muertas que se apoyan en ramas cruzadas a 2 y 5 m por encima del suelo. En Ecuador se encontró un nido a finales de febrero con un huevo podrido y un polluelo recién eclosionado, el huevo era turquesa con manchas marrón y medía 33.5 x 28 mm. En Colombia se reportó un espécimen en condiciones reproductivas en agosto en la parte terminal de los Andes orientales (Hilty & Brown, 1986). También se han reportado volantones en noviembre al nororiente de Ecuador, en diciembre en Bolivia (La Paz) y marzo en Perú (Apurímac); y juveniles en junio en Venezuela (Krabbe et al., 2003).

feedingUnstructured: La especie consume insectos y forrajea principalmente en el suelo. En ocasiones vuelan muy cerca del suelo con la cabeza inclinada para después lanzarse rápidamente a su presa. En el momento de la ingesta suelen hinchar las plumas y abrir las dos alas al tiempo que se balancean sobre sus piernas una o dos veces para luego seguir saltando mientras forrajea (Krabbe et al., 2003).

behaviorUnstructured: Es una especie principalmente terrestre. Es usual verla saltando desde matorrales densos hacia áreas abiertas, con pastos cortos y claros en donde se alimentan. Usualmente son individuos solitarios y en ocasiones retirados. Tienen un vuelo caracterizado por ser directo y de baja altura (Hilty & Brown, 1986; Restall et al., 2006).

Su canto ha sido documentado con una duración de entre 4 y 5 segundos, consiste en una serie de vibratos que aumentan gradualmente el volumen y el tono y justo antes de finalizar hace un aumento de tono como un salto seguido de una caída (Hilty & Brown, 1986). Onomatopéyicamente esta descrito como un profundo rrhooh-rrhooh-rrhooh (Krabbe et al., 2003).

distributionUnstructured: Es un hormiguero de gran tamaño que se distribuye por los Andes, su rango en Sudamérica inicia desde el suroccidente de Venezuela y desciende por los Andes, pasando por Colombia, Ecuador, Perú hasta Bolivia. En Colombia se distribuye en las tres cordilleras (BirdLife International and NatureServe, 2014; Hilty & Brown, 1986).  
El Tororoi Ondulado tiene un rango altitudinal entre los 2300 y los 3800 msnm, (Hilty & Brown, 1986) incluso se ha reportado en 1830 msnm (Hilty & Brown, 1986; Restall et al., 2006).

abstract: Es uno de los hormigueros más grandes de los Andes, que se encuentra desde el suroccidente de Venezuela hasta el centro de Bolivia. El Tororoi ondulado puede ser muy difícil de ver, a pesar de que es un ave local y común; pero es fácil de reconocer su presencia debido a su vocalización ventrílocua. Habita en los estratos más bajos de los bosques húmedos montanos, incluyendo bosques de gran altitud como los bosques de Queñua (*Polylepis*); con frecuencia se asocia con matorrales de bambú (*Chusquea*). La especie algunas veces se aventura a campos abiertos con buena luz durante la madrugada o en la tarde, sobre todo cuando hay niebla. Su patrón de coloración es básicamente marrón oscuro por arriba con una corona más gris y la nuca, la garganta y la región del bigote son blancos, separados por una línea malar negra estrecha, mientras que las partes inferiores son predominantemente naranja a ocre con manchas negras en forma de escama (Krabbe et al., 2003).
