reproductionUnstructured: Los machos levantan su cresta para atraer a la hembra, quien selecciona al macho con la cresta más grande; unos pocos machos se aparean con la mayoría de las hembras (promiscuidad) (EOL, n.d.; Hilty & Brown, 1986). Los patos reales generalmente se reproducen entre los meses de agosto a mayo, las hembras construye el nido con ramas, troncos y barro dentro de un árbol hueco de aproximadamente 18 m de altura. Las hembras ponen e incuban en promedio 11 huevos color crema (EOL, n.d.; Hilty & Brown, 1986), el periodo de incubación es de 35 días; las hembras protegen y enseñan a sus crías a nadar y a alimentarse (EOL, n.d.).

behaviorUnstructured: Generalmente en parejas o pequeños grupos hasta de una docena; grupos mayores hasta 100 actualmente raros; se posa y descansa en árboles altos. Las poblaciones silvestres son notablemente ariscas y raramente se asocian con otras especies de patos, en contraste con individuos domésticos de esta especie (Hilty & Brown, 1986). En algunas zonas de distribución el Pato Real prefiere dormir en el agua para escapar fácilmente de los depredadores (perros, zorros); particularmente en las zonas de reproducción de Norteamérica hacen dormideros comunales (EOL, n.d.). Se comunican con señales visuales, como moviendo la cola, subir y bajar la cabeza.

Durante el apareamiento los machos levantan la cresta para atraer a la hembra y también para ejercer dominio sobre los otros machos (EOL, n.d.). Las poblaciones domésticas suelen ser agresivas y muerden para protegerse (EOL, n.d.). Es una especie generalmente silenciosa (Alderfer et al., 2006), pero se registran algunas vocalizaciones de la hembra como un suave quack, el macho da varios silbidos rítmicos (Sibley, 2000); se comunican con silbidos o graznidos cuando hay alguna amenaza (EOL, n.d.).

distributionUnstructured: El Pato Real es una especie nativa de México, Centroamérica y Sudamérica. Las poblaciones silvestres viven en la parte baja del río Grande en Texas, al sur de Florida; así como varios sitios de Norteamérica, incluyendo el sur de Canadá (EOL, n.d.). En Colombia principalmente debajo de 500 msnm en todas las regiones con hábitat adecuado; errantes hasta 2600 msnm en cordillera Oriental desde el sur de Boyacá (Laguna de Fúquene) hasta la Sabana de Bogotá (Hilty & Brown, 1986).

abstract: El Pato Real es una especie nativa de México, Centroamérica y Sudamérica. Las poblaciones silvestres viven en la parte baja del río Grande en Texas, al sur de Florida; así como varios sitios de Norteamérica, incluyendo el sur de Canadá (EOL, n.d.). Esta especie ha sido domesticada y se ha adaptado muy bien a climas fríos (-12°C) y es capaz de sobrevivir aún en condiciones más frías por lo cual es común verle en alrededor en parques, granjas y jardines (Alderfer et al., 2006; EOL, n.d.). Las poblaciones domésticas se conocen comúnmente como “Pato Criollo”, han sido criados desde tiempos precolombinos por los nativos americanos, son más pesados y menos capaces de volar largas distancias y su plumaje suele ser variable (EOL, n.d.). El Pato Real es una especie muy grande, el macho mide 84 cm y la hembra 66 cm, plumaje negro con lustre verdoso y cresta hirsuta (Hilty & Brown, 1986; Kaufman, 2005), pico gris con banda diagonal negra alrededor del centro, carúnculas rojas alrededor de región ocular desnuda y en base del pico; grandes parches escapulares blancos y coberteras alares internas blancas (Hilty & Brown, 1986). Generalmente en parejas o pequeños grupos hasta de una docena; grupos mayores hasta 100

actualmente raros; se posa y descansa en árboles altos. Las poblaciones silvestres son notablemente ariscos y raramente se asocian con otras especies de patos, en contraste con individuos domésticos de esta especie (Hilty & Brown, 1986). Habita en manglares, arroyos de bosque, pantanos, lagunas de agua dulce cerca de áreas boscosas y áreas forestales cerca de cuerpos de agua (Hilty & Brown, 1986; Sibley, 2000); crean sus nidos y descansan en los árboles (EOL, n.d.). Es omnívora, se alimenta de raíces, tallos, hojas y semillas; también consume peces, reptiles, crustáceos, moluscos e insectos (EOL, n.d.). Aunque las poblaciones silvestres están disminuyendo, los patos reales tienen un amplio rango de distribución por lo cual se consideran en preocupación menor (Alderfer et al., 2006; BirdLife International and NatureServe, 2014).
