fullDescriptionUnstructured: Mide 17 cm. Adultos principalmente gris oliva o verde oliva, con más amarillento en la cabeza, partes bajas y coberteras alares. Alas desde la mitad hasta la punta negro, llamativo en vuelo, formando un gran triángulo negro (Hilty & Brown, 1986). Por su parte los juveniles son similares a los adultos pero más opacos y grisáceos en general (Asociación Bogotana de Ornitología, 2000).

reproductionUnstructured: El periodo de reproducción se ha reportado de enero a junio en Panamá, julio a septiembre y diciembre en Colombia, enero en Guyana, diciembre a septiembre en Suriname, julio en Guyana Francesa, en todos los meses en Trinidad y de octubre a diciembre en Brasil. El nido es construido por ambos sexos, en Costa Rica una taza limpia de hierba, tiras de hojas secas, fibras de palma y similares, colocado a 6 o 30 m por encima del suelo en palmas, racimo de la hojas, epífitas, cavidades o grietas e incluso en edificaciones. Pone 2 huevos, azul pálido muy manchados de lila y marrón; La incubación es realizada por la hembra y dura cerca de 14 días; Los polluelos son alimentados por ambos adultos por un periodo de 17 a 21 días. Nidos a veces parasitados por el Chamón (*Molothrus bonariensis*) (Hilty, 2011).

behaviorUnstructured: A menudo solitarios o en pequeños y ruidosos grupos que se reúnen en las copas de los árboles con frecuencia en compañía de *T. episcopus* pero generalmente en menor proporción (Asociación Bogotana de Ornitología, 2000).

Voz chillona, parecida a la del Azulejo pero más estridente y metálica. Los reclamos incluyen silbidos agudos y altos. El canto es una serie de frases cortas chirriantes, más estructurado que el del Azulejo (*Thraupis episcopus*) (Asociación Bogotana de Ornitología, 2000).

abstract: El Azulejo Palmero es una de las aves más comunes y familiares de los bosques de tierras bajas húmedas del neotrópico, distribuyéndose desde Nicaragua hasta el sur de Brasil. Esta especie es muy similar en varios aspectos al Azulejo (*Thraupis episcopus*), aunque el Azulejo Palmero tiene menos probabilidad de colonizar centros urbanos, como lo hace el Azulejo. Esta especie es común en las fronteras forestales, pero también se encuentran en el dosel del interior del bosque. Como su nombre indica, a menudo se asocian con palmeras, pero de ninguna manera está restringida a vivir en estas. Su dieta es más o menos igual de equilibrada entre el consumo de frutas y artrópodos. Cuando forrajea, que a menudo se aferran a la parte inferior de las hojas grandes, como a los extremos de las hojas de palma y el yarumo (*Cecropia*). El Azulejo Palmero suele desplazarse en parejas o en pequeños grupos y comúnmente se unen agregaciones de otras especies en árboles frutales (The Cornell Lab of Ornithology, 2010).
