habitatUnstructured: La especie es común en pastizales, llanuras fluviales y zonas pantanosas abiertas con vegetación enmarañada de baja altura. Durante la temporada no reproductiva también se encuentra en los humedales y marismas interiores; ocasionalmente en áreas abiertas en el bosque o incluso en los jardines urbanos (Wiersma & Bonan, 2013).

fullDescriptionUnstructured: Mide de 32 a 38 cm. Ambos sexos son similares. Presenta pico rosa con punta negra, patas rosa y una cresta occipital larga y aguda negra. Por encima es principalmente gris pardusco con hombros verde bronceo. Tiene la frente, parche gular y pecho negros. Su vientre y rabadilla son blancos y su cola negra. Al vuelo muestra sus alas negras con parche blanco en la cobertoras. Los jóvenes tienen las puntas de las plumas de la cabeza ante, máscara facial blanca reducida y teñida de ante y banda pectoral difusa (Hilty & Brown, 1986).

identifier:

reproductionUnstructured: Es una especie monógama. Es territorial y muy agresivo. Comportamientos cooperativos en el cuidado de las crías se han observado en Venezuela, con 2-3 adultos o inmaduros ayudando en la defensa

del territorio. El nido se ubica en pequeñas depresiones del suelo escasamente forrado con gramíneas (pastos) y por lo general es ubicado en un lugar seco o muy cerca de zonas húmedas. Pone cuatro huevos, en ocasiones tres, café oliva y manchados con negro; el periodo de incubación es de aproximadamente 27 días (Hilty & Brown, 1986; Wiersma & Bonan, 2013).

distributionUnstructured: El Alcaraván es una especie exclusiva de Sudamérica presente en casi todos sus países, de norte a sur, aunque es accidental en Perú (BirdLife International and NatureServe, 2014; Santos, 2010). En Colombia es común en todo el territorio (Hilty & Brown, 1986).

La especie se encuentra entre los 0 y los 2600 msnm en la cordillera Oriental de los Andes. Hasta los 3100 msnm en el Parque Nacional Puracé (Hilty & Brown, 1986).

abstract: El Alcaraván es un habitante conspicuo de praderas y pastos en Panamá y el norte de Sudamérica, hasta el sur del continente en Tierra del Fuego. Se alimentan principalmente de insectos, así como pequeños peces e invertebrados acuáticos. Son muy sedentarios, pero las poblaciones en el extremo sur de su área de distribución migran hacia zonas más cálidas en el invierno. La especie se adapta bien a la perturbación humana y están aumentando su rango de distribución en respuesta a la deforestación y el cultivo (Santos, 2010).
