reproductionUnstructured: En Colombia, se han registrado en junio hembras en condición reproductiva al suroriente de Antioquia (Hilty & Brown, 1986). En Norteamérica, la especie construye un nido voluminoso, una plataforma de palos y ramas de aproximadamente 35-60 cm de ancho y 10 a 20 cm de profundidad. Ambos miembros de la pareja llevan el material de anidación al sitio, pero la hembra hace la mayor parte o la totalidad de la construcción. La especie utiliza árboles de coníferas (pino, abeto) como sitios de anidación, pero también puede utilizar álamos y árboles de madera dura. El nido se coloca siempre debajo de la cobertura vegetal densa, por lo general, en la parte superior de un árbol alto, pero muy por debajo del dosel. La mayoría de los nidos están anclados entre las ramas horizontales y el tronco del árbol. Durante su época de reproducción, son tranquilas y anidan en parejas debajo de la cobertura vegetal espesa; quizás para evitar su propia depredación (Bowman et al., 2011; White & Marks, 2014).

feedingUnstructured: Las presas y hábitos alimenticios de las formas sudamericanas son poco conocidas (Márquez, Bechard, Gast, & Vanegas, 2005). No obstante, se posa escondido en el follaje y se lanza veloz por entre los árboles en persecución de aves pequeñas principalmente, como lo hacen sus parientes más cercanos (White & Marks, 2014). Sin embargo, se conoce para las formas norteamericanas, que el 90% de su dieta son aves cantoras; las aves más grandes están en menor riesgo, aunque no son completamente seguros. También comen pequeños

roedores, como ratones y topillos, y ocasionalmente polillas y saltamontes. En temporadas de anidación, gran parte de la comida que le dan a sus polluelos consiste en pichones y polluelos de otras aves (Bowman et al., 2011).

behaviorUnstructured: Es un ave principalmente asociada al bosque, poco conspicuo posándose escondida en el follaje (Hilty & Brown, 1986; Restall, Rodner, & Lentino, 2006). Son "cazadores" de persecución, a menudo sorprendiendo a sus presas desde una posición oculta. Son versátiles, ya que toman aves más pequeñas desde el aire o en el suelo; pueden saltar desde perchas tan sólo a 3 m de altura para atrapar roedores y algunos insectos al vuelo. Son voladores ágiles y acrobáticos, vuelan por los bosques densos a altas velocidades utilizando su larga cola como timón. En áreas abiertas a veces vuelan muy bajo, permaneciendo ocultos a la presa hasta el último momento. Son un poco más sociables durante la migración viajando en pequeños grupos (Bowman et al., 2011).

Sus vocalizaciones son a menudo ruidosas, emite un qui qui qui cacareado y agudo (Hilty & Brown, 1986; Restall et al., 2006).

distributionUnstructured: El Gavilán de Montaña habita comúnmente entre 900 y 2700 msnm (Hilty & Brown, 1986) pero se puede observar a una altura mínima de 300 y una máxima de 3500 msnm (Ferguson-Lees & Christie, 2001) y se distribuye desde Canadá y Norteamérica pasando por Costa Rica, Nicaragua, Islas Caimán, Panamá, noroccidente de Venezuela, Colombia y baja por los Andes hasta el norte de Argentina, Paraguay, suroriente de Brasil e islas Malvinas. En Colombia la especie se encuentra en la Sierra Nevada de Santa Marta, Serranía del Perijá, Serranía de la Macarena y las tres cordilleras de los Andes. Todas las formas suramericanas son residentes (BirdLife International and NatureServe, 2014; Hilty & Brown, 1986).

abstract: El Gavilán de Montaña es un halcón pequeño de hábitats boscosos. Está muy ampliamente distribuido a través de Norteamérica y continúa hacia el sur hasta el norte de Argentina. Habita principalmente en las regiones montañosas al oriente de Sudamérica. La subespecie más septentrional es altamente migratoria y las poblaciones que se reproducen en el sur de Sudamérica también pueden ser migratorias. Este pequeño gavilán caza principalmente aves (Schulenberg, 2010).
