identifier:

habitatUnstructured: La Tangara Veranera en la época reproductiva prefiere zonas de bosques caducifolios abiertos o bosques de pinos, en zonas al sur de Norteamérica busca álamos y sauces de poca altura (Alderfer et al., 2006; EOL, n.d.). En las zonas de migración intenta buscar zonas con vegetación similar, sin embargo por la circunstancias de transformación del paisaje y la vegetación, es fácil verla en jardines, parques arbolados, rondas de ríos, entre otros (Asociación Bogotana de Ornitología, 2000; EOL, n.d.).

fullDescriptionUnstructured: Ave de mediano tamaño (16.5cm) con pico grueso amarillo pálido. Los machos completamente rojo claro a rosado, con las alas y la cola manchados de negro, dando un tinte más oscuro. Las hembras amarillo oliva, también con las alas y cola más oscuras. Los machos jóvenes son como una transición

entre hembra y macho adulto, por lo que es frecuente ver algunos amarillos con manchas rojizas en su cuerpo (Asociación Bogotana de Ornitología, 2000; Alderfer et al., 2006; Hilty & Brown, 1986).

reproductionUnstructured: La elaboración del nido lo realizan las hembras, mientras que el macho solo acompaña, utilizan hierbas secas. Las hembras empollan el huevo y los machos solo buscan alimento y en algunas ocasiones lo comparten con la hembra. Colocan entre 3 y 4 huevos azulados o verdosos, con manchas marrón, que eclosionan a los 11-12 días (Alderfer et al., 2006; EOL, n.d.).

behaviorUnstructured: Bastante individuales, hasta la época reproductiva donde los machos cantan vigorosamente para atraer las hembras, y tendrán una sola pareja por temporada. En migración, vuelan en grupos grandes, aunque son autónomos en búsqueda de alimento y movimientos locales (Asociación Bogotana de Ornitología, 2000; Alderfer et al., 2006; EOL, n.d.).

Los machos tiene un canto que realizan en la zona de reproducción, que consiste en una serie de silbidos cortos separados por pausas breves, entre 5-7 silbidos (EOL, n.d.). En zona no reproductiva solamente emite un corto reclamo enfático píc a tup (Asociación Bogotana de Ornitología, 2000).

distributionUnstructured: Se distribuye desde el centro de Norteamérica, en donde se reproduce entre la primavera y el verano, con una buena distribución por los países de Centroamérica y el norte de Sudamérica. Se va reduciendo a zonas exclusivas de los Andes hasta el centro de Bolivia. Su distribución en Centro y Sudamérica hace parte de su migración y estadía en las temporadas de otoño e invierno (Asociación Bogotana de Ornitología, 2000; BirdLife International and NatureServe, 2014; Hilty & Brown, 1986). En Colombia puede observarse en la época de migración en todo el país, especialmente en áreas boscosas (Asociación Bogotana de Ornitología, 2000). La Tangara Veranera se distribuye altitudinalmente desde el nivel del mar hasta los 3000 msnm (Asociación Bogotana de Ornitología, 2000).

abstract: La Tangara Veranera es una especie de ave migratoria boreal, que toma a Centroamérica y las Islas de Caribe, como ruta para llegar a Sudamérica (BirdLife International and NatureServe, 2014). Es una especie muy común y llamativa en época migratoria, puede hacerlo en bandadas mixtas, especialmente con la Tangara Escarlata (*Piranga olivaceae*) (Asociación Bogotana de Ornitología, 2000; Botero et al., 2012). Es una especie de tamaño mediano, de pico grueso y pálido. Los machos son completamente rojos, con tintes rosados, con la cola y las alas teñidas con algo de negro. Las hembras son amarillo oliva también con las alas un poco más oscuras. Los machos jóvenes pueden verse como una transición entre hembra y macho adulto, por lo que es frecuente ver algunos amarillos con manchas rojizas en su cuerpo (Asociación Bogotana de Ornitología, 2000; Alderfer et al., 2006; Hilty & Brown, 1986).
