fullDescriptionUnstructured: El Pibí Ahumado mide aproximadamente 17 cm; es un atrapamosca distintivo por su coloración oscura, cresta corta y la costumbre de pararse con postura erecta en las copas de los árboles. Los adultos son por encima gris oscuro, más oscuro en el copete; dos barras alares poco llamativas de gris más claro, por debajo gris un poco más pálido. Maxila negra, mandíbula anaranjada o amarillenta. Los juveniles son más cafecino en general con barras alares angostas de color ocre (Asociación Bogotana de Ornitología, 2000).

behaviorUnstructured: Es una especie confiada, pasiva (Narosky & Yzurieta, 2010) y solitaria excepto en temporada reproductiva (Hilty & Brown, 1986); se posa erecto y alerta en ramas secas, usualmente en alturas medias y raramente en el dosel; más raro aún en la copa de los árboles. Hace vuelos medios a largos y usualmente regresa a la misma percha (Hilty & Brown, 1986).

El reclamo usual es un pip pip pip pip brillante y vivaz, a menudo persistente desde la percha prominente. El canto al amanecer es un juiirit o pirpiiriTT enfático (Hilty & Brown, 1986). También otros reclamos como un alto y penetrante uiuiui y un pit pit pit que puede repetir dos y tres veces seguidas (Asociación Bogotana de Ornitología, 2000; Narosky & Yzurieta, 2010).

distributionUnstructured: El Pibí Ahumado se distribuye desde Costa Rica, occidente de Panamá, norte y sur de Venezuela por los Andes hasta el noroccidente de Argentina. En Colombia desde la Serranía de Perijá y los Andes (Hilty & Brown, 1986).  
Se distribuye entre los 300 msnm a los 3000 msnm (principalmente entre los 1500 msnm), pero comúnmente hasta los 500 msnm en la vertiente Pacífica (Hilty & Brown, 1986).

abstract: El Pibí Ahumado mide aproximadamente 17 cm; es un atrapamosca distintivo por su coloración oscura, cresta corta y la costumbre de pararse con postura erecta en las copas de los árboles (Asociación Bogotana de Ornitología, 2000); su plumaje gris pizarra uniforme, algo más pálido por debajo, especialmente en el abdomen y con mandíbula inferior amarillenta (Hilty & Brown, 1986). Es una especie confiada y pasiva; habita en árboles secos (Narosky & Yzurieta, 2010); bordes de bosques primarios o secundarios, bosques abiertos de alisos o Eucaliptos (Asociación Bogotana de Ornitología, 2000). Tiene un amplio rango de distribución, la tendencia de la población es estable y se encuentra en categoría de amenaza de Preocupación Menor (BirdLife International and NatureServe, 2014).
