fullDescriptionUnstructured: Mide 9.4 cm. Pico corto (18 mm) y recto. El macho es completamente verde brillante por encima, corona púrpura; frente verde azul (inconspicua en campo); cabeza y parte del cuello negro con gorguera y parte anterior del cuello rosa amatista brillante y por debajo de ésta en el pecho, una banda ancha blanca en forma de media luna. Flancos verde pálido, resto de partes bajas ante, plumas centrales de la cola verde bronce y el resto azul oscuro. La hembra es similar pero la garganta es oxidada y moteada con negro (Hilty & Brown, 1986).

feedingUnstructured: La especie forrajea en los estratos bajos y medios y se alimenta de néctar e insectos (BirdLife International, 2014). Defiende territorios de alimentación donde se concentran fuentes de néctar, preferentemente

de plantas con corolas cortas como *Cavendishia*, *Palicourea* y *Aphelandra*. A menudo se puede ver alimentándose en los árboles en estratos bajos o medios siempre cerca de interior o en el borde del bosque (Heynen & Boesman, 2015). La especie también caza insectos realizando salidas cortas desde perchas bajas. Frecuentemente es activo alrededor de bandadas mixtas (Hilty & Brown, 1986).

distributionUnstructured: El Ángel Gorgiamatista se distribuye en Sudamérica desde Venezuela hasta Bolivia. Sin embargo se incluyen seis subespecies, un grupo de tres subespecies se encuentra en el norte del continente en los Andes del noreste de Colombia y Venezuela y otras tres desde el sur de Ecuador al sur de Bolivia (BirdLife International and NatureServe, 2014; The Cornell Lab of Ornithology, 2011). En Colombia, la especie se distribuye en Perijá y en la cordillera Oriental desde Norte de Santander (Páramo de Tamá) hasta Bogotá (Hilty & Brown, 1986).
La especie se encuentra entre los 2000 y los 3000 msnm (Hilty & Brown, 1986).

abstract: El Ángel Gorgiamatista se distribuye en Sudamérica desde Venezuela hasta Bolivia. Sin embargo se incluyen seis subespecies, un grupo de tres subespecies se encuentra en el norte del continente en los Andes del noreste de Colombia y Venezuela y otras tres desde el sur de Ecuador al sur de Bolivia (The Cornell Lab of Ornithology, 2011). La especie es bastante común en bosque húmedo de montaña, bordes de bosque y vegetación de crecimiento secundario. Parece preferir cañadas tupidas y por lo general se mantiene en el interior del bosque o cerca de los bordes (Heynen & Boesman, 2015; Hilty & Brown, 1986). Forrajea en los estratos bajos y medios y se alimenta de néctar e insectos (BirdLife International, 2014).
