fullDescriptionUnstructured: La forma de esta especie es variable e individual en cada localidad donde se distribuye. La banda de la mediana de las alas posteriores abajo es más proximal en los individuos de las Guayanas y la parte inferior media en el Amazonas que en las muestras de los Andes (Rothschild-Rothschild & Jordan, 1906).

Las bandas de la primera y segunda de las alas anteriores alcanzan por lo general mas allá de SM2, a veces se extiende a la margen posterior, pero también se presentan las muestras en las que ambos grupos se detienen en SM2. La cuarta banda se extiende sobre todo a través de dos - tercios de la celda, a menudo cerca de la consecución de los márgenes posteriores de la celda, a veces se reduce a un punto costal pequeño. Las celdas de bandas suelen ser más bien pesados en las muestras de la Guayana, la cuarta llega a menudo casi o totalmente a través de la celda. El espacio intermedio submarginal transparente lleva en costales el tercero, a veces casi todos tienen las escalas de color marrón en vez de los blancos, las escamas marrones ocupan en conjunto una mayor porción del espacio transparente que en las formas anteriores geográficas. La posición de la banda media de las alas posteriores es algo variable, las muestras de los Andes de acuerdo en la posición de la banda y el grado de la escala de color rojo con achelais (Rothschild-Rothschild & Jordan, 1906).

abstract: Esta especie de mariposa de la familia Papilionidae se distribuye en Sudamérica desde el Amazonas hasta los Andes. Las bandas de esta especie, 1 y 2 de las alas posteriores por lo general se extienden más allá de la submedial 2, la banda 4 en su mayoría va más allá de la mitad de la celda y, a veces llega a dificultar su margen, la banda submarginal transparente tiene por lo menos en el costal escalas marrón, las alas posteriores son con más fuerza dentada que en *Glaucolus leucas*. En las muestras de los Andes, se encuentran a menudo completamente negro-marrón. (Seitz, 1924).
