dataType:  
identifier:

behaviorUnstructured: Diurno, principalmente arbóreo, aunque puede caminar sobre el suelo y por lo general realiza movimientos en grupos. Gregario e inevitablemente en grupos pequeños, laxos, conspicuos y familiares en todas partes. Se posa en arbustos, árboles pequeños, en el suelo o alineados en cercos. Vuelo débil y apenas utilitario, unos pocos aletazos rápidos seguidos por un planeo. Su nombre se debe a su frecuente asociación con el ganado y al hábito ocasional de desprender garrapatas de los vacunos. Se ha beneficiado grandemente por la deforestación, especialmente en elevaciones altas. Es un Uiiic o uuuuuiic quejumbroso prolongado, a veces repetido, especialmente en vuelo.
