reproductionUnstructured: La cópula puede durar una hora. Luego de ésta, la pareja se separa y el macho vigila a la hembra mientras ovoposita. Para desovar hunde el abdomen en el agua e inserta los huevos en ramitas; también pueden poner los huevos en el agua que se deposita en la base de las hojas de bromelias.

dataObject:

identifier:

feedingUnstructured: Vuelan lentamente sobre el follaje y se alimentan de pequeños insectos posados sobre la superficie de las hojas, los capturan y luego se los comen en una percha cercana. A veces se suspenden en vuelo cerca de telarañas, en busca de presas atrapadas, incluso atacan a la araña, arrancándola repentinamente de la telaraña, sin quedar atrapados en ella por la rapidez del movimiento.

behaviorUnstructured: Vuela lentamente en claros del bosque o a grandes alturas, generalmente en el dosel. Al posarse se cuelgan de la punta de ramas ubicadas entre 1.5 a 3 m, cuando terminan su periodo de actividad se posan aún más alto. Las puntas coloreadas de las alas producen un curioso efecto visual cuando vuelan, como si las giraran completamente, asemejando las aspas de un helicóptero (de ahí su nombre común).
