reproductionUnstructured: En Colombia se han registrado eventos reproductivos en las tres cordilleras entre mayo y diciembre, con presencia de un nido en enero en el Parque Nacional Natural Cueva de los Guacharos (Hilty & Brown, 1986).Hacen sus nidos bajo hojas de helecho (Chaves & Sedgwick, 2011). El nido presenta forma de copa voluminosa elaborada con musgo y telarañas, muy bien forrada con fibra vegetal. Es construido en troncos cubiertos de musgo o en las crestas rocosas, de vez en cuando a la entrada de las cuevas, a una altura de 1.3 m. La hembra pone dos huevos y dura entre 17 y 18 días incubándolos. Los juveniles permanecen con la hembra adulta durante 3-4 semanas (Schuchmann, 2013).

feedingUnstructured: Generalmente se alimenta de las flores en matorrales a lo largo de senderos y bordes (*Fuchsia*, *Impatiens*, *Palicourea*, *Psammisia*, *Lobelia*). Para alimentarse, revolotea o se posa sobre las flores. A menudo captura insectos al vuelo vigorosamente y algunas veces rebusca en el follaje denso. Sin embargo, las flores que visita están dispersas y suele recoger el néctar de flores tubuladas cortas o roban el néctar por agujeros en la base de flores tubulares largas. También consume algunos insectos que colecta de la superficie de las hojas (Chaves & Sedgwick, 2011; Schuchmann, 2013).

behaviorUnstructured: Usualmente solitario, ocasionalmente en parejas en estrato bajo o a baja altura en bordes sombreados. Revolotea, a menudo colgando o perchado al libar. No se congrega en grupos en árboles con flor como lo hacen otras especies. Principalmente sedentario; individuos pueden dispersarse a altitudes más bajas después de la época de cría (Hilty & Brown, 1986; Schuchmann, 2013). Hace un dit-dik de tono bajo, como piedrecitas chocando, mientras forrajea (Hilty & Brown, 1986).

distributionUnstructured: El Colibrí Pechipunteado habita entre los 1000 y 2500 msnm, pero es más común sobre los 1300 msnm (Hilty & Brown, 1986; Schuchmann, 2013). Se distribuye desde el norte de Venezuela, pasando por Colombia, Ecuador, Perú, Bolivia, hasta el noroccidente de Argentina. La especie en Colombia se encuentra en la Serranía del Perijá y la cordillera Oriental, como también en la cordillera Occidental y Central hasta cerca de Popayán, Cauca. Se ha registrado en la cabecera del río Magdalena en el sur del Huila y las montañas de Nariño (BirdLife International and NatureServe, 2014; Hilty & Brown, 1986).

abstract: El Colibrí Pechipunteado es realmente difícil ver. Este monótono colibrí tiene un parche en la mejilla negro bordeado por una franja blanca detrás del ojo y algunas veces se asemeja a un ermitaño. Habita los bosques húmedos y lluviosos y más a menudo es observado alimentándose en arbustos oscuros a lo largo de las carreteras o en los matorrales en el sotobosque. Se alimentan de flores dispersas y especialmente recogen el néctar de flores tubulares cortas o roban el néctar por agujeros en la base de las flores tubulares largas. Sus nidos son colgantes y los construyen debajo de hojas de helecho (Chaves & Sedgwick, 2011).
