fullDescriptionUnstructured: Las alas anteriores de esta subespecie poseen una mancha beige en la punta de las celdas, ya sea por encima y por debajo, o sólo a por debajo, a menudo tiene vestigios, en la parte inferior del disco. El macho generalmente tiene beige de M1 hacia adelante, no hay punto empezando M1 o solo detrás del mismo, rara hay un punto distinto entre M1-M2, la mancha se encuentra a veces en las subespecies que tienen una celda de puntos en la parte superior, las manchas beige son mayores en mujeres, las filas a menudo se extienden hacia atrás hasta SM2, allí empiezan barras submarginales distales de los parches en muchos individuos(Rothschild & Jordan 1906).

Las alas posteriores son algo variables en forma, siendo proporcionalmente menor en algunos ejemplares que en otros, las dos filas de manchas rojas en la parte inferior son a veces muy distantes y pequeñas, estos individuos se reconocen por la posición más proximal de la línea anterior de puntos, por el color pálido de los puntos de R2-M3 de la fila distal, y por los lugares marginales de color beige, al no ser marcados con rojizo; la celda frecuentemente tiene un punto apical rojizo, especialmente en las mujeres (Rothschild & Jordan 1906).
