fullDescriptionUnstructured: Mide 14.5 cm. Pico y patas oscuras. El macho es gris oscuro, ligeramente pálido por debajo; cola notablemente larga (6 cm) y generalmente permanece erguida hacia arriba a la altura del pico. La hembra es similar pero las plumas de la espalda y partes inferiores café. Los juveniles café canela por encima, leonado ocre por debajo con barras subterminales negras sobre las plumas terciarias, algunas veces también en las coberteras (Hilty & Brown, 1986).

reproductionUnstructured: Dentro de los datos del periodo de reproducción se reportan polluelos en junio al sureste

de Ecuador y en agosto en Perú (La Libertad); breve período de actividad de canto sugiere que puede ser un solo periodo de reproducción en el año (Krabbe & Schulenberg, 2003).

distributionUnstructured: La especie se distribuye principalmente en Sudamérica desde Colombia hasta Perú. En Colombia se registra en la cordillera Occidental en el páramo del Sol, municipio de Urrao, al occidente de la cordillera Central en Caldas (Nevado del Ruiz), en la cordillera Oriental en Norte de Santander (Páramo de Tamá) y en Cundinamarca (BirdLife International and NatureServe, 2014; Flórez et al, 2004; Hilty & Brown, 1986). La especie se encuentra principalmente entre los 2400 y los 3100 msnm (Hilty & Brown, 1986).

abstract: El Tapaculo Ceniza es un ave oscura y de tamaño mediano con una cola larga que generalmente permanece erguida hacia arriba a la altura del pico. Se encuentra en densos matorrales montanos húmedos de zonas altas y relativamente inexploradas. En consecuencia, se sabe muy poco acerca de la ecología de forrajeo y reproducción de la especie. En ocasiones se ubica en el género *Scytalopus*, y todavía hay un debate activo en cuanto a que género pertenece esta especie. Aunque es poco común a lo largo de su rango de distribución, el Tapaculo Ceniza aún no ha sido incluido en las listas de especies amenazadas (The Cornell Lab of Ornithology, 2010).
