behaviorUnstructured: Es una especie de hábitos sociales por lo que típicamente se encuentra en grupos de tamaño variable, desde unos pocos individuos a varias docenas o más, caminando, explorando pisos blandos en dehesas pantanosas o en orillas de lagunas (Hilty & Brown, 1986). Pueden volar dando aletazos bien rápidos y directos aterrizando algo brusco en zonas planas, suelen ser algo torpes al momento de posarse sobre ramas. A menudo en vuelo hace formación en "V" o en líneas difusas. Pueden volar grandes distancias principalmente entre los 5 a 30 m de altura del suelo, así como sobrevolar cortas distancias cuando se está alimentando (Hilty & Brown, 1986). El Coquito descansa en colonias que hacen en árboles de moderada altura (Alcaldía de Santiago de Cali

Departamento Administrativo de Gestión del Medio Ambiente, 2010; Narosky & Yzurieta, 2010). Es una especie generalmente silenciosa cuando se encuentra lejos de su nido. La vocalización más común del Coquito es un muy rápido cucucucucucu parecido al de un pavo (Hilty & Brown, 1986).

abstract: El Coquito es una especie de ibis que mide aproximadamente entre 48 y 51 cm, tiene pico largo y decurvado rosado a café rojizo, piel facial desnuda y patas rojas (Alcaldía de Santiago de Cali Departamento Administrativo de Gestión del Medio Ambiente, 2010). Es una especie vadeadora, suele verse en potreros húmedos, charcos, orillas de ríos, vegetación emergente explorando con el pico en el fango en busca de crustáceos, insectos y otras pequeñas presas (Hilty & Brown, 1986). Típicamente en grupos de tamaño variable, desde unos pocos individuos a varias docenas o más caminando y explorando el suelo lodoso (Narosky & Yzurieta, 2010). El Coquito tiene un amplio rango de distribución y en las zonas donde habita es una especie común (BirdLife International and NatureServe, 2014).
