fullDescriptionUnstructured: Su silueta general es delgada, cola larga y alas de punta redondeada, mide aproximadamente 30 cm de largo y 60 g de peso. Pecho, vientre y región anal blancos, mientras que el cuello, espalda, la coronilla y cabeza son principalmente grises. Las primarias de las alas son rojizas y las rectrices cafés machadas con franjas blancas. Anillo ocular amarillo, pico curvo y delgado con el culmen y la maxila en general

negros. La mandíbula es amarilla, con la punta negra. Los individuos inmaduros son bastante similares a los adultos pero con coberteras infracaudales anteadas. El patrón de la cola no es tan marcado y el anillo orbital es de un amarillo más opaco (Asociación Bogotana de Ornitología, 2000; Alderfer et al., 2006; EOL, 2014). briefDescription:

mimeType: dataType: identifier:

reproductionUnstructured: El macho corteja a la hembra apartándose de la rama de percha y agachando sus hombros hacia ella; durante la cópula ambos están agarrados a la rama de la percha. Posteriormente tanto el macho y la hembra construyen juntos un nido de forma plana y oblicua de aproximadamente 20 centímetros de diámetro usando ramas que encuentran en el suelo o sueltas en árboles. Localizan los nidos en árboles de altura media que les pueden servir también de lugar de forrajeo. El tamaño de la nidada oscila entre 1 a 5 huevos con un periodo de incubación de aproximadamente 10 días. La cría nace a los 8 días de la puesta del huevo, cubierta de plumón y con los ojos abiertos. Los huevos son lisos, verde azulados sin marca. Cuando la hembra está receptiva se percha en una rama con la cabeza arriba (Cornell University, 2014; EOL, 2014).

modified: created: mimeType: dataType:
identifier: behaviorUnstructured: Es común verlo en bosques densos, donde forrajea principalmente perchado y observando en busca de alimento, especialmente orugas. Atrapa sus presas con un salto o vuelo sobre ellas. Suele tomar una postura en la que encorva sus hombros para tratar de ocultar su pecho blanco. En la Sabana de Bogotá es común observar aves cansadas del viaje de migración, por lo que es frecuente registrar choques contra ventanas y vidrios (Asociación Bogotana de Ornitología, 2000; Cornell University, 2014).
En Norteamérica los machos vocalizan una serie de sonidos huecos pausados en sílabas "ka-ka-ka-ka-ka-kow-kow-kowlp-kowlp-kowlp". Tanto machos como hembras emiten sonidos durante el cortejo, que son suaves a manera de arrullo. En época de migración no emite vocalizaciones, por lo que en su estadía en Colombia y el resto de sus zonas de invernada es generalmente silenciosa (Asociación Bogotana de Ornitología, 2000; Cornell University, 2014).

distributionUnstructured: Esta especie de cuco se distribuye en el oriente de Norteamérica sin embargo existen algunos registros ocasionales en el oeste. Durante la migración se distribuyen en toda Centroamérica incluyendo algunas islas del Caribe y en Sudamérica hasta el oriente de Perú y el Norte de Argentina. En Colombia se distribuye por todo el territorio nacional en época de invernada (Asociación Bogotana de Ornitología, 2000; Alderfer et al., 2006; Hilty & Brown, 1986). Tiene una distribución altitudinal bastante amplia, se puede encontrar desde el nivel del mar hasta los 2600 msnm (Asociación Bogotana de Ornitología, 2000; Alderfer et al., 2006; Hilty & Brown, 1986; Morales-Rozo, 2012).

relatedTo: measurementRemarks: measurementMethod: measurementDeterminedDate: measurementUnit: measurementAccuracy: measurementValue: measurementType: measurementID: abstract: Migratorio boreal común en buena parte de Colombia, especialmente en la zona andina. Es café grisáceo por encima y blanco por debajo, normalmente tímido pero fácil de ver, tiene una figura delgada y cola larga, el pico curvo, con la maxila negra y la mandíbula amarilla muy característico (Asociación Bogotana de Ornitología, 2000; Hilty & Brown, 1986; Morales-Rozo, 2012). En la cara, un anillo ocular amarillo muy útil para su identificación. Es una especie que se reproduce en Norteamérica y empieza su migración a mediados de julio, para llegar a Sudamérica en los meses de septiembre y octubre. Consume principalmente insectos con movimientos poco vistosos y aparentemente con baja actividad (Alderfer et al., 2006; Morales-Rozo, 2012).

The entire period from egg laying to fledgling leaving the nest lasts only 17 days. On day six or seven after hatching the feathers of the young burst out of their sheaths, allowing the nestling to become fully feathered in two hours.

Birds! Awesome. Who'd want to shoot anything else.
