behaviorUnstructured: Es una especie vivaz y alerta; puede verse a las parejas patrullando pequeñas áreas se de arroyos rocosos y se ven a menudo posados en piedras grandes, lechos o en ramas sobre el agua (Hilty & Brown, 1986). Vuelan corto a las superficie de la rocas o a la vegetación de las orillas para para capturar insectos; a menudo cuando están posados menean la cola hacia arriba y abajo. A veces son muy mansos; se les encuentra en parejas o solitarios (Asociación Bogotana de Ornitología, 2000; Hilty & Brown, 1986).

Emite un reclamo como un psiiiit alto, agudo y penetrante pero no muy fuerte; también un chip abrupto repetido frecuentemente que se eleva sobre el ruido del agua en los torrentes (Asociación Bogotana de Ornitología, 2000; Hilty & Brown, 1986). Canta en dueto varios chip's al amanecer igual pero más lento (Hilty & Brown, 1986).

distributionUnstructured: Se distribuye desde Costa Rica y occidente de Panamá; noroccidente de Venezuela; por el sur de los Andes hasta el norte de Bolivia. En Colombia se distribuye desde la Sierra Nevada de Santa Marta, Serranía de Perijá y las tres cordilleras (Hilty & Brown, 1986). Es poco común y muy localizado en la Sabana de Bogotá, principalmente en las partes planas en las zonas rurales; evita áreas urbanizadas y es escaso en los cerros; registrado cerca de los pozos termales de Tabio (Cundinamarca), la Laguna del Salitre, el Humedal de la Conejera y

al lado del río Teusacá y del río Bogotá (Asociación Bogotana de Ornitología, 2000). Entre los 1800 msnm y los 2800 msnm (Asociación Bogotana de Ornitología, 2000).

abstract: El Tiranuelo Saltarroyo mide 12 cm aproximadamente. Ningún otro mosquerito tiene plumaje gris, ni se encuentra casi siempre sobre el suelo cerca del agua. Los adultos tienen el plumaje del cuerpo completamente gris claro, algo más claro en el vientre; cabeza, alas y cola negruzcas, barras alares angostas blanquecinas; pico y patas negros. Casi siempre se encuentra cerca del agua, sea una quebrada, una laguna o charco, un humedal o hasta una zanja o potrero inundado; se posa sobre rocas, vegetación acuática o el mismo suelo, o a poca altura sobre vegetación de la orilla o una cerca (Asociación Bogotana de Ornitología, 2000). No se confunde fácilmente, comparte su hábitat de torrente de montaña únicamente con el Mirlo de Agua (Cinclus leucocephalus), Atrapamoscas Guardapuente (Sayornis nigricans) y Pato de Torrente (Merganetta armata) (Hilty & Brown, 1986). Tiene un amplio rango de distribución; la tendencia de la población está disminuyendo, por lo tanto se encuentra en categoría de Preocupación Menor (BirdLife International, 2012).
