fullDescriptionUnstructured: Mide entre 28 y 38 cm. Inconfundible por su cola larga y ahorquillada, más larga en machos. Los adultos tienen la cabeza negra con un parche amarillo oculto en la coronilla, espalda gris claro, alas gris oscuro, cola negra; por debajo blanco; pico y patas negros. Los inmaduros son por encima teñidos de café, las plumas de las alas con márgenes acanelados, con coronilla parduzca. Individuos en muda sin cola larga pueden ser confundidos con Tyrannus tyrannus, pero esta especie nunca muestra un contraste fuerte entre la cabeza y la espalda (Asociación Bogotana de Ornitología, 2000; Hilty & Brown, 1986). briefDescription:

reproductionUnstructured: El periodo de reproducción de la especie esta reportado entre marzo y junio en Costa Rica, enero a mayo en Colombia. Nidos encontrados en octubre en Venezuela (oeste de Apure) y de octubre a enero en Argentina. El nido es una copa poco profunda compuesto por fibras de plantas y hojas y generalmente es puesto sobre un árbol o arbusto de 1 a 10 m de altura. Pone de 2 a 3 huevos y el período de incubación es de 14 a 17 días. Los nidos son parasitados por el Chamón Común (Molothrus bonariensis) (Mobley, 2004).

feedingUnstructured: Consume principalmente insectos, los cuales caza generalmente desde una percha expuesta, realizando largas y a veces acrobáticas salidas en busca de las presas. También bayas y frutos fuera de la época de reproducción. Por lo general, se posa en los niveles más bajos (a menudo a un metro o menos), en la parte superior de los arbustos, árboles pequeños y también en cercas y cables (Mobley, 2004). De vez en cuando se alimentan cerca del suelo o el agua (Asociación Bogotana de Ornitología, 2000).

behaviorUnstructured: Puede observarse individualmente, en parejas o en pequeños grupos familiares, también grandes bandadas durante la migración y en la temporada no reproductiva (Mobley, 2004). En general el Tijereto es bastante tranquilo, incluso durante la época de reproducción. Emite una nota fina y débil tic- jek o tzig, a veces en

serie rápida y sobre todo en vuelo. El macho emite un tzig - tzig - zizizizizi ag ag ag ag ag ag durante exhibición aérea; a veces también un sonido similar a un traqueteo seco, especialmente durante el cortejo (Mobley, 2004).

distributionUnstructured: Se distribuye desde el sur de México hasta el centro de Argentina y Paraguay, pasando por las Antillas Holandesas, Barbados, Bolivia, Brasil, Belice, Chile, Colombia, Costa Rica, Cuba, Ecuador, las Malvinas, Granada, Guyana Francesa, Guatemala, Guyana, Honduras, Nicaragua, Panamá, Perú, Surinam, Trinidad y Tobago, Uruguay y Venezuela (Fierro-Calderón, 2012). En Colombia la subespecie (Tyrannus savana savana) se distribuye a los largo de las tres cordilleras excepto al sur occidente (Nariño) y se extiende al oriente (BirdLife International and NatureServe, 2014).

Se encuentra en casi todo el neotrópico del sur de México hasta Paraguay, generalmente por debajo de los 2500 msnm (Asociación Bogotana de Ornitología, 2000). Individuos transitorios registrados a 2400 msnm en tierras altas de Centroamérica y en los Andes de 2500 a 3100 msnm (y para 4100 msnm en Perú) (Mobley, 2004).

populationBiologyUnstructured: Se estima que la población total esta entre 5, 000,000-50, 000,000 individuos. Se
sospecha que la población de esta especie es estable debido a su carácter nómada y su capacidad para prosperar
en una amplia gama de hábitats abiertos (BirdLife International, 2014).

abstract: El Tijereto es un invernante con poblaciones reproductivas permanentes en Colombia. Las poblaciones migratorias del sur del continente que corresponden a la subespecie Tyrannus savana savana, invernan en el norte y oriente de los Andes hasta Colombia, Venezuela, Guyanas y Trinidad. Se cree que las aves de Centroamérica de la subespecie Tyrannus savana monachus, migran al norte de Sudamérica (Fierro-Calderón, 2012; Hilty & Brown, 1986). El Tijereto es un habitante característico de pastizales y terreno abierto desde el sur de México hasta Argentina. Como su nombre indica, tiene una cola muy larga en forma de horquilla. A menudo se posa de forma destacada en la parte superior de los postes o arbustos; desde esas perchas visibles captura insectos. Durante la migración la especie es muy gregaria y pueden agruparse en bandadas de hasta 10.000 individuos (Jahn & Tuero, 2013).
