fullDescriptionUnstructured: La especie llega a medir hasta 51cm. Posee un pico entre 94-114 cm, (nigrirostris) o negro con la base de la mandíbula inferior roja (occidentalis y spilorhynchus), extendida hacia adelante por la mandíbula superior casi hasta la punta. La coronilla y nuca son negras; resto café oliva con rabadilla amarilla; la cola es negra con ápice castaño; la garganta y lados de la cabeza son blancos; resto de las partes inferiores son gris azulado; el abdomen es rojo. El área ocular es desnuda azul al frente y amarillo por detrás (Hilty & Brown, 1986). briefDescription:

reproductionUnstructured: El periodo reproductivo se ha reportado en agosto-noviembre al occidente de Venezuela, marzo-agosto en Colombia y probablemente en meses similares o poco después en Ecuador. No se han reportado nidos y huevos; al parecer anidan en cavidades de árboles de 20 m. Se han registrado cuatro aves en condición reproductiva en marzo en el suroccidente del Huila, en huecos de árboles a gran altura (Hilty & Brown, 1986; Short, 2002).

behaviorUnstructured: Usualmente se observan con frecuencia en parejas o grupos de hasta cinco individuos, algunas veces silenciosos, pero por lo general muy bulliciosos, tiene varios sonidos pero el más usual semeja a una ametralladora de juguete; común en el dosel, estrato medio alto y algunas veces en el sotobosque (Losada, Martínez, Molina, González Prieto, & Carvajal, 2003). El canto más común está compuesto con cuatro a ocho notas dddt individuales o en parejas, seguidos por una serie de bajos, incluso agudo, silban notas y gritos nasales cro-ak, co-ak. También posee otra vocalización, un tu-aat, nasal y mecánico, repetido a un poco más de un segundo; la última silaba es ascendente, suena como latón y con fuertes armónicos; también castañeos huecos del pico (Hilty & Brown, 1986; Restall et al., 2006).

distributionUnstructured: El Tucán Pechiazul habita entre los 1600 y 3200 msnm; en la vertiente Pacífica desciende hasta 1200 msnm (Hilty & Brown, 1986). Se considera una especie casi endémica de Colombia (Chaparro-Herrera, Echeverry-Galvis, Córdoba-Córdoba, & Sua-Becerra, 2013), distribuyéndose desde el noroccidente de Venezuela pasando por Colombia hasta Ecuador. La especie en Colombia se encuentra en la región Pacífica y en la vertiente oriental de la cordillera Oriental hacia el sur por lo menos hasta Cundinamarca y occidente de Caquetá. Está en la cordillera Occidental hacia el sur hasta Cauca; también en ambas vertientes de la cordillera Central, registros en la cabecera del río Magdalena en Huila y vertiente oriental de los Andes en Putumayo y Nariño (BirdLife International and NatureServe, 2014; Garcés-Restrepo, 2014; Hilty & Brown, 1986).

abstract: El Tucán Pechiazul se identifica fácilmente entre los tucanes por su pico enteramente negro (nigrirostris) o negro con la base de la mandíbula inferior roja (occidentalis y spilorhynchus) extendida hacia adelante por la mandíbula superior casi hasta la punta. El Tucán Pechiazul habita los bosques montanos y bosques de niebla subtropicales y templados. Con mayor frecuencia se encuentra en zonas con epífitas y cerca del agua, pero también habitan en las zonas cultivadas, áreas abiertas con árboles frutales y en matorrales. Se observa en parejas, familias o pequeños grupos juntos buscando alimento en el dosel o en las copas de los árboles. Tienden a cubrir distancias impresionantes cuando se están alimentando (Sedgwick, 2011).
