fullDescriptionUnstructured: El Rastrojero Rabilargo mide entre 17 y 18 cm. Cola muy larga y fuertemente graduada, 10 rectrices ligeramente desintegradas o desgastadas en las puntas; la cola es un poco más oscura que la espalda. La cara es marrón grisáceo, frente café oliva; coronilla, hombros y base de las primarias rufo; resto café grisáceo, más pálido debajo; blanco grisáceo en el abdomen; garganta negruzca bordeada de blanquecino a los lados. Garganta gris con plumas más oscurecidas en el centro que dan la apariencia de un moteado; la parte oscura de la garganta es parcialmente oculta por las márgenes grisáceas de las plumas; partes inferiores oliva opaco teñido de marrón grisáceo, el vientre es más pálido; iris marrón rojizo oscuro; mandíbula superior-gris negruzco e inferior gris; tarso y dedos de los pies gris. Ambos sexos son similares, los juveniles tienen la corona menos castaña (Hilty & Brown, 1986; Remsen, 2003). Ha sido relacionada con S. azarae y S. courseni por la distribución y la similitud superficial del plumaje, la vocalización es muy diferente. Por similitudes vocales se ha dicho que es cercana al grupo formado por S. macconnelli, S. moesta y S. cabanisi (Remsen, 2003).

behaviorUnstructured: Generalmente en parejas que se mueven rápidamente por los matorrales enmarañados y se escucha con más frecuencia de lo que se ve; salta y trepa activamente por la vegetación, por lo general en parejas y cerca del suelo (Asociación Bogotana de Ornitología, 2000; Hilty & Brown, 1986).

El canto es un parloteo fuerte o un gorjeo nasal, con una rápida y descendente serie de notas que se van acelerando, como una carcajada con énfasis al principio Chi-chi-chi-che-che-che-chu-chu-chu, a menudo en dúo no sincronizado o contestado inmediatamente. El llamado es un kik agudo, a veces repetido; la alarma es un trino bajo (Asociación Bogotana de Ornitología, 2000; Hilty & Brown, 1986; Remsen, 2003).

distributionUnstructured: El Rastrojero Rabilargo es endémico a la cordillera Oriental de Colombia, tiene una distribución restringida al Norte de Boyacá y Cundinamarca en el área de Bogotá (Asociación Bogotana de Ornitología, 2000; Remsen, 2003). Se encuentra desde los 1200 hasta los 3200 msnm (Hilty & Brown, 1986), principalmente por encima de 2100 msnm (Asociación Bogotana de Ornitología, 2000; Remsen, 2003).

relatedTo: measurementRemarks: measurementMethod: measurementDeterminedDate: measurementUnit: measurementAccuracy: measurementValue: measurementType: measurementID: abstract: El Rastrojero Rabilargo es un furnárido endémico al oriente de los Andes de Colombia. Está asociado a

matorrales y rastrojo alto en bosques abiertos, también en claros de maleza entre los 1200 y los 3200 msnm. Es del tamaño de un Copetón (Zonotrichia capensis) pero con una cola muy larga y terminada en espinas; café opaco por encima, gorra y alas rufas y cola café grisácea (Asociación Bogotana de Ornitología, 2000; Johnson, 2010). Se le observa en parejas aunque es más lo que se les puede oír, generalmente un canto va como respuesta del otro. Buscan insectos entre los matorrales dando saltos intermitentes o sale momentáneamente a la copa de un árbol (Asociación Bogotana de Ornitología, 2000; BirdLife International, 2014; Hilty & Brown, 1986; Johnson, 2010; Remsen, 2003).
