fullDescriptionUnstructured: Mide 18 cm; como una mirla. El pico no es notablemente fuerte, la mandíbula es casi en línea recta, la maxila ligeramente curvada (20 mm). Presenta coloración marrón opaco por encima y marrón grisáceo más pálido por debajo; ceja blanquecina; garganta blancuzca oscureciéndose progresivamente; pecho en escala de marrón oscuro; partes teñidas de marrón; coberteras alares bordeadas con ante; ápice de las remeras oscuro con un parche canela en la base (forma una franja en el ala conspicua en vuelo); cola marrón, los tres pares exteriores de plumas en su mayoría canela (Hilty & Brown, 1986). Ridgely y Tudor (1994) dividieron las subespecies de C. fuscus en tres grupos en función de la morfología. El primer grupo incluyó sólo la subespecie. C. f. fuscus; el segundo grupo incluye las formas de los Andes centrales (presumiblemente C. f albiventris, C. f tucumanus, C. f yzurietae, C. f riojanus, y C. f rufus); y el tercer grupo incluye las formas de los Andes del norte (C.

f. albidiventris, C. f. Oreobates y C. f. heterurus). Jaramillo (2003) sugiere que estos grupos probablemente deben ser reconocidos como diferentes especies, basado en la morfología, vocalizaciones y comportamiento (Sann, 2009).

abstract: El Cínclodes Alirufo es una especie casi endémica de Colombia, que comparte su rango de distribución con Venezuela, Ecuador y la parte norte de Perú (BirdLife International and NatureServe, 2014; Chaparro-Herrera et al., 2013). Esta especie recientemente se ha dividido en tres especies con base a una combinación de factores genéticos, vocales, plumaje y datos de comportamiento. Es un habitante común en general de los pastizales templados y matorrales montanos áridos, donde corre o salta en el suelo y generalmente se observa fácilmente, llamando la atención del observador, en particular a través de su exhibición de meneo de alas (The Cornell Lab of Ornithology, 2011). Consume principalmente invertebrados y en menor proporción semillas (Remsen, 2003). Se puede observar solo o en parejas caminando o corriendo buscando pequeños artrópodos. Generalmente prefieren permanecer cerca del agua o en bordes de lagunas (Hilty & Brown, 1986).
