habitatUnstructured: En México y Centroamérica habita en tierras altas de pinos y bosques de robles (Stiles & Skutch, 1995). En el neotrópico la Paloma Collareja se encuentra por lo regular en el dosel del bosque o en matorrales nativos altos (Asociación Bogotana de Ornitología, 2000), selvas húmedas de montaña; claros con árboles grandes dispersos y aún laderas abruptas enrrastrojadas (Hilty & Brown, 1986). En Colombia por lo general se encuentra en montañas altoandinas, así como áreas grandes con árboles dispersos y laderas empinadas achaparradas (Hilty & Brown, 1986).

Es común la ingesta de minerales; por lo cual la Paloma Collareja muestra una fuerte fidelidad en áreas arenosas; comúnmente en época reproductiva donde el consumo de minerales es vital para la producción de calcio (NatureServe, 2014).

fullDescriptionUnstructured: La Paloma Collareja mide aproximadamente 30 cm y pesa 315 g. Es una paloma grande con cola larga, pico amarillo y una media luna blanca conspicua en la nuca; una faja negruzca que separa el tercio distal gris claro de la base oscura de la cola. El macho adulto tiene la cabeza y la mayor parte de la región inferior púrpura opaco, que se desvanece a blancuzco en las coberteras infracaudales. Parte posterior del cuello verde iridiscente lustroso, espalda gris oliváceo oscuro con lustre verde bronceado. Alas gris oscuro. Iris rojo purpúreo, párpados rojo coral, pico, cera y patas amarillos. La hembra es más gris y menos púrpura por debajo, con menos verde en la parte posterior del cuello (Cifuentes-Sarmiento, 2012). Anteriormente Columba fasciata (Say, 1822). Cambio de acuerdo con la propuesta (47) del South American Classification Committee: (Banks, 2003). briefDescription:

rights: Asociación Bogotana de Ornitología license: Atribución - No Comercial - Compartir igual (CC BY-NC-SA 4.0) modified: created: mimeType: dataType: identifier: reproductionUnstructured: En el trópico su ciclo reproductivo es variable, y se da en diferentes épocas del año (Hilty & Brown, 1986); mientras que para Norteamérica su temporada de reproducción inicia en marzo hasta finales de mayo; la hembra construye el nido, pero el macho es quien le proporciona los materiales para su construcción (EOL, n.d.). El nido es una plataforma de palitos puesto frecuentemente sobre una rama horizontal entre 2.5 y 15 m de altura, en arbusto grande o árbol (Asociación Bogotana de Ornitología, 2000). Los huevos son incubados por ambos sexos; pueden ser blancos, amarillos o azul claro con pequeñas manchas blancas en el extremo más grande. La incubación dura entre 18 y 20 días y luego de la eclosión los juveniles abandonan el nido a los 28 días (EOL, n.d.).

behaviorUnstructured: Es una especie gregaria, generalmente en grupos pequeños, pero en ocasiones formando grandes bandadas. El despliegue del macho consiste de vuelos en círculos con las alas extendidas y la cola abierta, acompañado de vocalizaciones La Paloma Collareja es una especie bastante asustadiza; al detectar la presencia del hombre sale huyendo con un vuelo potente y rápido (Asociación Bogotana de Ornitología, 2000). Esta especie efectúa migraciones altitudinales estacionales. Desciende desde las partes altas de las cordilleras hasta 900 msnm. Asimismo, es una especie nómada. Sus individuos forrajean diariamente sobre un amplio ámbito de territorio (Cifuentes-Sarmiento, 2012). Durante el cortejo, el macho trae comida a la hembra que golpea sus alas en postura de mendicidad (EOL, n.d.).

Entre sus varias vocalizaciones es frecuente una suave serie de cu wuuh, cu uuuuh similar al llamado de un búho (Asociación Bogotana de Ornitología, 2000; Dunn & Aldefer, 2006) también un grave y carrasposo grru repetido un par de veces por el macho mientras vuela en círculos y un fuerte grrrraak!. De igual manera es característico el fuerte sonido clap, clap, clap de las alas al volar (Asociación Bogotana de Ornitología, 2000).

distributionUnstructured: La Paloma Collareja se distribuye desde el occidente de Norteamérica; Panamá, Colombia, norte de Venezuela, Brasil hasta el noroccidente de Argentina (Hilty & Brown, 1986). En Colombia esta especie se registra desde la Sierra Nevada de Santa Marta, Serranía de Perijá y en las tres cordilleras (Hilty & Brown, 1986). Se distribuye entre los 900 y 3000 msnm (Cifuentes-Sarmiento, 2012; Hilty & Brown, 1986).

abstract: La Paloma Collareja es una especie arbórea; mide aproximadamente 30 cm (Asociación Bogotana de Ornitología, 2000). Es grande y robusta con cola ancha en forma de abanico (Hilty & Brown, 1986). Los adultos tienen el plumaje por encima gris cafecino oscuro, la cabeza con tinte vináceo y la parte superior de la espalda con metálico verde bronceado; collar nucal blanco, generalmente conspicuo (Asociación Bogotana de Ornitología, 2000). Es una especie bastante gregaria (Asociación Bogotana de Ornitología, 2000) y generalista; es común verla posada en el dosel de los árboles, en bosques premontanos (Narosky & Yzurieta, 2010). También se alimenta en zonas de cultivo, jardines suburbanos y parques (zonas subtropicales y templadas) (NatureServe, 2014). La Paloma Collareja tiene un amplio rango de distribución y a pesar que el tamaño de la población, es fluctuante y algunas localidades donde habita se encuentran amenazados por la fragmentación; esta especie se encuentra en categoría de preocupación menor (LC) (BirdLife International, 2014).
